Executive Summary

Science, technology, engineering and mathematics (STEM) workers drive our nation’s innovation and competitiveness by generating new ideas, new companies and new industries. However, U.S. businesses frequently voice concerns over the supply and availability of STEM workers. Over the past 10 years, growth in STEM jobs was three times as fast as growth in non-STEM jobs. STEM workers are also less likely to experience joblessness than their non-STEM counterparts. Science, technology, engineering and mathematics workers play a key role in the sustained growth and stability of the U.S. economy, and are a critical component to helping the U.S. win the future.

- In 2010, there were 7.6 million STEM workers in the United States, representing about 1 in 18 workers.
- STEM occupations are projected to grow by 17.0 percent from 2008 to 2018, compared to 9.8 percent growth for non-STEM occupations.
- STEM workers command higher wages, earning 26 percent more than their non-STEM counterparts.
- More than two-thirds of STEM workers have at least a college degree, compared to less than one-third of non-STEM workers.
- STEM degree holders enjoy higher earnings, regardless of whether they work in STEM or non-STEM occupations.

Figure 1. Recent and Projected Growth in STEM and Non-STEM Employment

What is STEM?

The acronym STEM is fairly specific in nature—referring to science, technology, engineering and math—however, there is no standard definition for what constitutes a STEM job. Science, technology, engineering and math positions consistently make the lists of STEM occupations, but there is less consensus about whether to include other positions such as educators, managers, technicians, health-care professionals or social scientists. In this report, we define STEM jobs to include professional and technical support occupations in the fields of computer science and mathematics, engineering, and life and physical sciences. Three management occupations are also included because of their clear ties to STEM. Because of data limitations, education jobs are not included. Further, we elected not to include social scientists.

Our STEM list contains 50 specific occupation codes (see Appendix Table 1), and in 2010, there were 7.6 million workers in these jobs, or 5.5 percent of the workforce. To better put these jobs into context, we divide STEM occupations into four categories: computer and math, engineering and surveying, physical and life sciences, and STEM managerial occupations. Across all levels of educational attainment, the largest group of STEM jobs is within the computer and math fields, which account for close to half (46 percent) of all STEM employment. Second are engineering and surveying occupations with one-third of all STEM employment, while 13 percent are in the physical and life sciences, and 9 percent in STEM management jobs.

Parallel to our list of STEM occupations, we also identify a set of STEM undergraduate degree fields that span computer science and mathematics, engineering, and life and physical sciences (see Appendix Table 2). We define STEM degree holders as persons whose primary or secondary undergraduate major was in a STEM field. Following similar logic to what we used in our occupation selection, we exclude business, healthcare, and social science majors.

STEM Employment and Worker Earnings

In 2010, 7.6 million people or 1 in 18 workers held STEM jobs. Although STEM employment currently makes up only a small fraction of total U.S. employment, STEM employment grew rapidly from 2000 to 2010, increasing 7.9 percent. In contrast, employment in non-STEM jobs grew just 2.6 percent over this period (see Figure 1). STEM jobs are projected to grow at a fast pace relative to other occupations. From 2008 to 2018, STEM jobs are expected to grow 17.0 percent compared to just 9.8 percent for non-STEM jobs.

Workers in STEM occupations also earn more on average than their counterparts in other jobs, regardless of their educational attainment. The STEM earnings differential is greatest for those with a high school diploma or less in comparison to their counterparts in a non-STEM field. On average, they earned almost $25 per hour, $9 more per hour than those in other occupations in 2010. It should be noted, however, that only about 1 out of every 10 STEM workers has a high school diploma or less. Those with graduate degrees in a STEM job earned more than $40 per hour, nearly $4.50 more per hour on average than those with non-STEM jobs.

The comparison of wage premiums raises several questions, including to what extent the STEM-earnings premium reflects other characteristics of workers, such as age, and how premiums have evolved over time. A regression analysis—which controls for a variety of demographic, geographic, and other worker characteristics—helps to address these questions. Using Current Population Survey public-use microdata for 1994-2010, we regressed the log of earnings against a standard list of characteristics that have typically been found to be related to earnings including age, marital status, race, ethnicity, region and industry.

After controlling for this set of characteristics, the
earning premium diminishes somewhat. However, the fundamental result that STEM workers enjoy large earnings premiums persists, most predominantly for workers with less than a college degree. STEM earnings premiums have also shown persistence over time, and have generally increased since the mid-1990s (see Figure 2). In 2010, workers in STEM jobs with less than a bachelor’s degree enjoyed a large premium (more than 30 percent) compared with non-STEM workers with the same education level, even after taking other influences on earnings into account. The regression-based premiums in 2010 were slightly less for workers with a bachelor’s (23 percent) or graduate degree (12 percent), and relatively closer to the premiums found in the simple comparison (without a regression adjustment). The overall regression-based STEM premium was 26 percent in 2010, up from 18 percent in 1994.

STEM Jobs and STEM Degrees

The analysis so far has focused on STEM jobs, but conversations about policy most often focus on STEM education. One source of information to analyze the link between STEM jobs and STEM education is the 2009 American Community Survey which collected information on college-educated individuals’ undergraduate majors. When examining the relationship between STEM education and STEM jobs, the following patterns emerge.

First, a STEM degree is the typical path to a STEM job, as more than two-thirds of the 4.7 million STEM workers with a college degree has an undergraduate STEM degree. However, this does not necessarily mean that STEM workers’ degrees are in the same STEM field as their jobs. For example, only 35 percent of college-educated computer and math workers have a degree in computer science or math while 27 percent majored in the physical or life sciences or engineering.

Second, in addition to STEM jobs, STEM degrees also open the door to many other career opportunities. Almost two-thirds of the 9.3 million workers with a STEM undergraduate degree work in a non-STEM job. Life and physical science majors are the STEM degree holders most likely to work in non-STEM jobs; 81 percent of these graduates work outside the STEM fields. (Note that “non-STEM” occupations include the 28 percent of graduates who work as healthcare practitioners or technicians, and the 12 percent who work in education.) In math, there is a strong pipeline into education jobs, as one-fifth of math majors go on to work in education.

As discussed above, STEM workers earn significantly more than their non-STEM counterparts, but what about the earnings of STEM degree holders who don’t necessarily work in STEM jobs? Using the 2009 American Community Survey public-use microdata, calculations of the regression-adjusted earnings premium of college-educated workers with a STEM degree and/or STEM job showed that all STEM degree holders receive an earnings premium relative to other college graduates, whether or not they end up in a STEM job. Likewise, college graduates, regardless of their major, enjoy an earnings premium for having a STEM job. The earnings premium for having a STEM job or a STEM degree is quite similar, at 13 percent and 11 percent, respectively. Still, a much

larger payoff tends to come when a STEM major goes on to work in a STEM job, as their earnings (all else equal) are about 20 percent higher than those of non-STEM majors working in non-STEM jobs.

**STEM Joblessness**

In addition to higher earnings, workers in STEM occupations on average experience lower unemployment rates than workers in other fields (see Figure 3). The unemployment rate for STEM workers rose from 1.8 percent in 2007 to 5.5 percent in 2009 before easing to 5.3 percent in 2010. The unemployment rate for non-STEM workers rose from 4.8 percent in 2007 to 9.5 percent in 2009 and then continued to increase to almost 10 percent in 2010. STEM workers, however, are not totally immune to economic downturns, as STEM joblessness did increase during the last two recessions.

Some of the difference in unemployment rates between STEM and non-STEM workers reflects differences in educational attainment. On balance, workers with a higher educational level tend to experience lower unemployment, and STEM workers tend to be better educated. Looking at workers with a bachelor’s degree or graduate degree, one finds less of a difference in unemployment rates between STEM and non-STEM workers than for those with less education. During the latest recession, the unemployment rate for college-educated STEM workers edged above the non-STEM rate in 2009, but the rate for both groups converged to 4.7 percent in 2010 (see Figure 4). While college-educated STEM workers were less likely to be jobless than other workers during the latter part of the last two economic expansions, they were more likely to be jobless during and after the 2001 recession. The decrease in the demand for information technology workers following the Y2K efforts and the crash of the Internet dot-com bubble likely played a role.
Educational Attainment of STEM Workers

One of the more distinguishing characteristics of STEM workers is their educational attainment. More than two-thirds (68 percent) of STEM workers have a bachelor’s degree or higher, compared to just under one-third (31 percent) of other workers age 16 and over (see Figure 5). Among the four STEM occupational groups, the physical and life sciences have the highest-educated workforce, with nearly 40 percent holding a graduate degree – about double the share for computer, math and engineering jobs. Nonetheless, because STEM includes professionals as well as first-tier support jobs, we find that a number of STEM workers have less than a four-year college degree; nearly one-quarter (23 percent) have completed an associate degree or at least some college, and 9 percent have a high school diploma or less. So while it is certainly true that the majority of STEM workers tend to have at least a bachelor’s degree, opportunities also exist for STEM workers with lower education levels.

Conclusions

The greatest advancements in our society from medicine to mechanics have come from the minds of those interested in or studied in the areas of STEM. Although still relatively small in number, the STEM workforce has an outsized impact on a nation’s competitiveness, economic growth, and overall standard of living. Analysis of data from the U.S. Census Bureau’s American Community Survey and Current Population Survey provide new insights into the growing STEM workforce that is central to our economic vitality. STEM jobs are the jobs of the future. They are essential for developing our technological innovation and global competitiveness.
These factors make STEM workers highly desirable to companies developing or operating on the technological forefront and extremely important to the U.S. economy, as competitive businesses are the foundation of a competitive economy. As this analysis highlights, STEM jobs should also be highly desirable to American workers. Regardless of educational attainment, entering a STEM profession is associated with higher earnings and reduced joblessness. For college graduates, there is a payoff in choosing to pursue a STEM degree, and for America’s workers, an even greater payoff in choosing a STEM career.

Endnotes

1 These occupations are computer and information systems managers, engineering managers, and natural sciences managers.

2 Although our principal data sources, the monthly Current Population Survey (CPS) and the 2009 American Community Survey (ACS), collect detailed information on workers’ occupations, they do not break out educators by their specific field. As a result, it is not possible to distinguish math and science professors from other professors. Data from the Bureau of Labor Statistics’ Occupational Employment Statistics program show that there are roughly 200,000 postsecondary teachers in STEM fields, and so their exclusion is unlikely to materially affect our results.

3 The National Science Foundation does count social scientists among “science and engineering jobs” in keeping with the agency’s mission supporting “all fields of fundamental science and engineering, except for medical sciences.”

4 The distinction between “scientists” rather than “science occupations” is more than just semantic as “science occupations” covers not just scientists but also science technicians. Likewise, engineering and surveying occupations include engineering technicians and drafters, and computer occupations range from computer support specialists to computer software engineers.

6 More specifically, the earnings regressions control for age (up to a fourth degree polynomial of age), gender, marital status, race and Hispanic origin, nativity and citizenship, educational attainment, metropolitan area, region, union representation, major industry, STEM occupation, time, and STEM occupation interacted with time.

7 For the regression analysis, we combined workers that had completed some college, high school, or less into a single “less than a bachelor’s degree” category because of small sample concerns.

8 One caveat with these results is that the STEM premium may also capture other unidentified factors that systematically distinguish STEM workers from other workers. STEM workers may have more in common than just their career fields, such as a similar work ethic or affinity, and the STEM premium could reflect the net impact of those unidentified common characteristics as well as the pure premium from working in a STEM job.

9 As mentioned earlier, a person whose primary or secondary major was in a STEM field is counted as having a STEM undergraduate degree.

10 In the Current Population Survey, occupations are assigned to persons based on their most recent work experience. As a result, unemployment rates by occupation are sometimes referred to as the “experienced unemployment rate.” Thus, if we define $U_{STEM}$ as the number of unemployed persons whose most recent job was in a STEM occupation and $E_{STEM}$ as the number of persons currently employed in a STEM occupation, then the STEM unemployment rate is calculated as $U_{STEM}/(E_{STEM} + U_{STEM})$.
